Abstract not available for EP 1267970 (A1)
 Abstract of corresponding document: GB 2360218 (A)

An inhaler for holds a canister 2 of medicament. The canister 2 has a mount 26 secured thereto mounting an indication member 41 movable slidably from a first state to a second state. A ratchet arrangement 41a, 42 is provided between the mount 26 and the indication member 41 to make the movement irreversible. The inhaler has a catch 49 for moving the indication member from the first state to the second state on removal of the canister 2 from the inhaler. An electrical switch contact 48 detects the state of the indication member 41, thereby providing an indication of whether the canister 2 has been used before. An LCD display is controlled in response to the detection.
